book_isbn (PK)	book_name	publisher_id (FK)	book_price

BookAuthors Table

book_isbn (FK)	author_id (FK)

I assumed each author only has one phone #, one email, and one address.

I assumed we would not be searching by the address (so no need to break it down by city/state but keep the entire address as one single string).

I assumed some books would have multiple authors.

I assumed there was only one copy of each book to track.
